//db_xref="taxon:458"
//clone_lib="Pathogen induced 1 (PII)"
//note="Organ: Anthracnose-infected leaves from localation;
two-week-old sorghum plants (ABTX 623
cultivar) were infected with pathogen (isolate FRM421 of Colletorrichum graminicola, which is a sorghum isolate).
RNA was prepared from infected leaves harvested from 45
seedlings (4 weeks old) exhibit juvenile resistant
reaction, which is an incompatible interaction. As they
grow older (4 weeks or older), plants resume susceptiblity
to anthracnose disease. The library was made from poly-A
RNA in the cloning vector lambda ZAP II. Clones to be
sequenced were prepared by mass excision. MARNING: While
most or all ESTs are expected to derive from the host
plant, no effort was made to eliminate ESTs deriving from
the pathogen."

New set of rice peroxidase genes in rice under varying conditions

for

analysis of peroxidase expression production of rice plants with

```
The present invention describes a set of peroxidase genes found in CC plants, especially rice, and their homologues, modified forms and CC fragments, where the sequences of the peroxidase genes in the set are CI given in Ani44071 to Ani44091. Also described are: (1) promoters for the CC control of the gene set; (2) the preparation of cassette vectors using CC the genes and promoters; (3) analysis of plant characteristics using the Peroxidase set by isolating RNA from the plant, binding the RNA to a CC membrane, mixing with a labelled peroxidase gene set, incubating, and CC detecting the label signal to show which genes in the set are expressed in the sample plant; and (4) DNA microarrays for peroxidase gene CC expression analysis. The set of genes are used for the analysis of the CC pattern of peroxidase gene expression in particular rice plants and CC and modification of rice plants to provide desired specificities of CC plants such as response to bacterial infection by Magnaporthe grisea. CC The present sequence represents a rice peroxidase encoded by a gene from CC the gene set described above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms -

                                                                                                                      ρy
                                                                                                                                                                                                                    The present invention describes a set of peroxidase genes found in CC plants, especially rice, and their homologues, modified forms and CC fragments, where the sequences of the peroxidase genes in the set are given in AnH44071 to ANH44091. Also described are: (1) promoters for the CC control of the gene set; (2) the preparation of cassette vectors using CC the genes and promoters; (3) analysis of plant characteristics using the peroxidase set by isolating RNA from the plant, binding the RNA to a CC membrane, mixing with a labelled peroxidase gene set, incubating, and CC detecting the label signal to show which genes in the set are expressed in the sample plant; and (4) DNA microarrays for peroxidase gene CC expression analysis. The set of genes are used for the analysis of the CC pattern of peroxidase gene expression in particular rice plants and CC detecting the component tissues and under different environmental conditions, CC and modification of rice plants to provide desired specificities of CC plants such as response to bacterial infection by Magnaporthe grisea.

CC The present sequence represents a rice peroxidase encoded by a gene from the gene set described above.

CC encoding and representing the enzymes cinnamatte 4-hydroxylase (C4H), CC coumarate 3-hydroxylase (C3H), phenolase (PNL), O-methyl transferase CC (OMT), cinnamyl alcohol dehydrogenase (CAD), cinnamyl-CoA reductase CC (CCR), phenylalanine ammonia-lyase (PAL), 4-coumarate:COA ligase (ACL), CC coniferol glucosyl transferase (CGT), coniferin beta-glucosidase (CBG), CC laccase, peroxidase, ferulate-5-hydroxylase (F5H), alpha-amylase, CC coniferol glucosyl transferase, caffeoyl CoA methyl transferase, CC coumerate COA ligase, cytochrome P450 LXXIA, diphenol oxidase, flavanol glucosyl transferase, flavenold hydroxylase, and isoflavone reductase, CC which are involved in the lignin biosynthetic pathway. The CC composition and the structure of a plant, especially eucalyptus and pine CC content, composition and for producing a plant having altered lignin CC content, composition and structure. They can be used for designing probes and primers useful for detecting similar DNA and RNA sequences in any cryanism and for PCR amplification. The lignin content can be efficiently condified using the polynucleotides. AAA67908 to AAA68201 and AAB16341 to

Also claimed are plant cells harboring the DNA construct, a plant comprising such cells, and material from such a plant, especially seed, politen, a stem segment or a cutting. Resistance to fungi, especially Phytophthora parasitica, Leptosphaeria maculans or Sclerotinia sclerotorium, can be conferred on cereal, legume, oilseed, sugar or fibre plants, particularly maize, banana, peanut, field pea, sunflower, tomato, canola, tobacco, wheat, barley, oat, potato, soybean, cotton,

CC plants, especially rice, and their homologues, modified forms and CC fragments, where the sequences of the peroxidase genes in the set are CC given in AAH44071 to AAH44091. Also described are: (1) promoters for the CC control of the gene set; (2) the preparation of cassette vectors using CC the genes and promoters; (3) analysis of plant characteristics using the CC peroxidase set by isolating RNA from the plant, binding the RNA to a CC membrane, mixing with a labelled peroxidase gene set, incubating, and CC detecting the label signal to show which genes in the set are expressed CC in the sample plant; and (4) DNA microarrays for peroxidase gene capression analysis. The set of genes are used for the analysis of the CC pattern of peroxidase gene expression in particular rice plants and CC their component tissues and under different environmental conditions, CC and modification of rice plants to provide desired specificities of CC peroxidase gene expression to impart particular characteristics to the CC plants such as response to bacterial infection by Magnaporthe grisea.

CC The present sequence represents a rice peroxidase encoded by a gene from CC the gene set described above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ohashi Y,

The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI;

The present invention describes a set of peroxidase genes found in CC plants, especially rice, and their homologues, modified forms and CC fragments, where the sequences of the peroxidase genes in the set are CC given in AAH44071 to AAH44091. Also described are: (1) promoters for the CC control of the gene set; (2) the preparation of cassette vectors using CC the genes and promoters; (3) analysis of plant characteristics using the CC peroxidase set by isolating RNA from the plant, binding the RNA to a CC membrane, mixing with a labelled peroxidase gene set, incubating, and CC detecting the label signal to show which genes in the set are expressed CC in the sample plant; and (4) DNA microarrays for peroxidase gene CC expression analysis. The set of genes are used for the analysis of the CC pattern of peroxidase gene expression in particular rice plants and CC their component tissues and under different environmental conditions, CC and modification of rice plants to provide desired specificities of CC plants such as response to bacterial infection by Magnaporthe grisea. CC The present sequence represents a rice peroxidase encoded by a gene from CC the gene set described above.

                                                                                                                                                                                           The present invention describes isolated polynucleotides and proteins CC encoding and representing the enzymes cinnamate 4-hydroxylase (C4H), CC coumarate 3-hydroxylase (C3H), phenolase (PNL), O-methyl transferase CC (OMT), cinnamyl alcohol dehydrogenase (CAD), cinnamyl-OcA reductase CC (CCR), phenylalanine ammonia-lyase (PAL), 4-coumarate:COA ligase (4CL), CC coniferol glucosyl transferase; (CGT), coniferin beta-glucosidase (CBG), CC caffeic acid methyl transferase, caffeoyl CA methyl transferase, CC coumerate COA ligase (YSC), CC caffeic acid methyl transferase, caffeoyl CAA methyl transferase, flavenold hydroxylase, and isoflavone reductase, CC coumerate COA ligase, flavenold hydroxylase, and isoflavone reductase, CC councerate COA ligase, flavenold hydroxylase, and isoflavone reductase, CC which are involved in the lignin blosynthetic pathway. The CC polynucleotides can be used for modulating lignin content, lignin CC content, composition and the structure of a plant, especially eucalyptus and pine CC specially and for producing a plant having altered lignin CC content, composition and structure. They can be used for designing probes CC and primers useful for detecting similar DAA and RNA sequences in any CC content, composition and structure. They can be used for designing probes CC and primers useful for detecting similar DAA and RNA sequences in any CC content and CC productation. The lignin content can be efficiently condified using the polynucleotides. AAA67908 to AAA68201 and AAB16341 to CC AAB16449 represent polynucleotides and protein sequences used in the CC exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel polynucleotide encoding enzymes involved in lignin-biosynthetic pathway useful for producing transgenic plants especially eucalyptus and pine species having altered lignin content, composition and

The present invention describes a set of peroxidase genes found in plants, especially rice, and their homologues, modified forms and fragments, where the sequences of the peroxidase genes in the set are given in AnH44071 to AnH44091. Also described are: (1) promoters for the control of the gene set; (2) the preparation of cassette vectors using the genes and promoters; (3) analysis of plant characteristics using the peroxidase set by isolating NNA from the plant, binding the RNA to a membrane, mixing with a labelled peroxidase gene set, incubating, and detecting the label signal to show which genes in the set are expressed

The set of genes are used for the analysis of the pattern of peroxidase gene expression in particular rice plants and their component tissues and under different environmental conditions, and modification of rice plants to provide desired specificities of peroxidase gene expression to impart particular characteristics to the plants such as response to bacterial infection by Magnaporthe grisea. The present sequence represents a rice peroxidase encoded by a gene from the gene set described above.
                                                                                                                                                                                                      06-SEP-2000
                                                                                                                                                                                                                                                                                           Protein identification; signal transduction pathway; metabolic hybridisation assay; genetic mapping; gene expression control; termination sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as herbicides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms.

First-strand cDNA was prepared from oligo-dT follows. First-strand cDNA was prepared from oligo-dT selected mRNA by priming with an XhoI oligo-dT primer. The resulting DNA:RNA hybrid was treated with RNase H and used as a template for DNA PolI-catalyzed second strand synthesis. After the addition of EcoRI adaptors, the ds-cDNAs were digested with XhoI and size-selected. The resulting molecules were directionally coloned into the EcoRI and XhoI sites of the HybridAP lambda vector (Stratagene) and excised as pAD-GAL4 phagemids."

                                                                                                                                                                                                                                                                                                                                                                                 follows. First-strand cDNA was prepared from oligo-dT selected mRNA by priming with an XhoI oligo-dT primer. The resulting DNA:RNA hybrid was treated with RNASE H and used as a template for DNA Poll-catalyzed second strand synthesis. After the addition of EcoRI adaptors, the ds-cDNAs were digested with XhoI and size-selected. The resulting molecules were directionally cloned into the EcoRI and XhoI sites of the HybriZAP lambda vector (Stratagene) and excised as pAD-GAL4 phagemids."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Vector: pBluescript II from Lambda Zap II; Site_1: XhoI; Site_2: ECORI; Two-week-old sorghum plants (BTX 623 cultivar) were infected with pathogen (Isolate FRM42I of Colletotrichum graminicola, which is a sorghum isolate). RNA was prepared from infected leaves harvested from 45 seedlings (2 weeks old) exhibit juvenile registant reaction, which is an incompatible interaction. As they grow older (4 weeks or older), plants resume susceptiblity to anthracnose disease. The library was made from poly-A RNA in the cloning vector lambda ZAP II. Clones to be sequenced were prepared by mass excision. WARNING: While most or all ESTs are expected to derive from the host plant, no effort was made to eliminate ESTs deriving from the pathogen."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vector: pBluescript II from Lambda Zap II; Site_1: XhoI; Site_2: EcoRI; Two-week-old sordhum plants (BTX 623; cultivar) were infected with pashbogen (Isolate PBMA2I of Colletotrichum graminicola, which is a sorghum isolate). RNA was prepared from infected leaves harvested from 45 seedlings 48 hours after inoculation. Note; young seedlings (2 weeks old) exhibit juvenile resistant reaction, which is an incompatible interaction. As they grow older (4 weeks or older), plants resume susceptiblity to anthracnose disease. The library was made from poly-A RNA in the cloning vector lambda ZAP II. Clones to be sequenced were prepared by mass excision. WARRING: While most or all ESTs are expected to derive from the host plant, no effort was made to eliminate ESTs deriving from the pathogen."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0;
